VPS Setup Guide

Keep desktop MetaTrader 5 running securely and consistently.

Software support material only. This guide does not provide financial advice or guarantee trading results.

Why use a VPS

A VPS can keep the desktop MT5 terminal running when the customer computer is off. It does not remove trading risk, broker outages, platform errors or internet failures.

VPS setup checklist

1. Choose a reputable Windows VPS located reasonably close to the broker server.
2. Use a unique strong password and enable multi-factor authentication where available.
3. Install MT5 from the official MetaQuotes page or the broker's official website.
4. Copy only the customer .ex5 and approved .set files to the VPS.
5. Set the correct Windows time zone and verify MT5 broker time separately.
6. Attach the EA to the correct symbol and timeframe, load the preset and verify the licence status.
7. Enable Algo Trading and check the Experts and Journal tabs for errors.
8. Disconnect the remote session without signing out or shutting down the VPS.

Daily check

Confirm the VPS is online, MT5 is connected, Algo Trading remains enabled and the EA status panel shows no licence or symbol error. Review open positions directly in MT5.

Remote-support safety

If remote help is required, download AnyDesk only from <https://anydesk.com/en/downloads>. Use attended access. Stay present during the session and end access when support is complete.

1. Do not enable permanent unattended access for ordinary installation support.
2. Do not disclose broker passwords, wallet credentials, seed phrases or private keys.
3. Close wallet, email and password-manager applications before a support session.
4. Remove AnyDesk or revoke its permissions after support if it is no longer needed.

Backups

Keep a private copy of the approved customer package, preset and order reference. Do not store passwords inside the trading journal or setup screenshots.

Updates and restarts

Install operating-system updates during a planned maintenance window. After any restart, confirm MT5 reopened, logged in and restored every required chart and EA.
